Chartbook: Stocks of Interest

- Note \$RDDT We have the daily recycle so you can buy this here. [Chart](#) 11h
- Note \$RDDT Now just below 100 and a concern. Also of concern is that this is a Cramer favorite. Buy a daily recycle as the weekly has recycled and looks ready to go. [Chart](#) 7d
- Note \$RDDT This is a daily recycle on a roughly 50% retracement. The weekly is oversold. I guess you can try this here if you want. Below 100 would be a concern. [Chart](#) 63d
- Note \$RDDT Daily has recycled but weekly has not. Hold unless trading then could go long. [Chart](#) 84d
- Note \$RDDT Daily is close to a recycle. Wait for it to kick in for a new buy. [Chart](#) 98d
- Note \$RDDT Broke through \$200. Let it continue to run higher. Shorts are getting killed here. [Chart](#) 112d
- Note \$RDDT No change, a hold but overextended. Below 170 would be a concern. [Chart](#) 126d

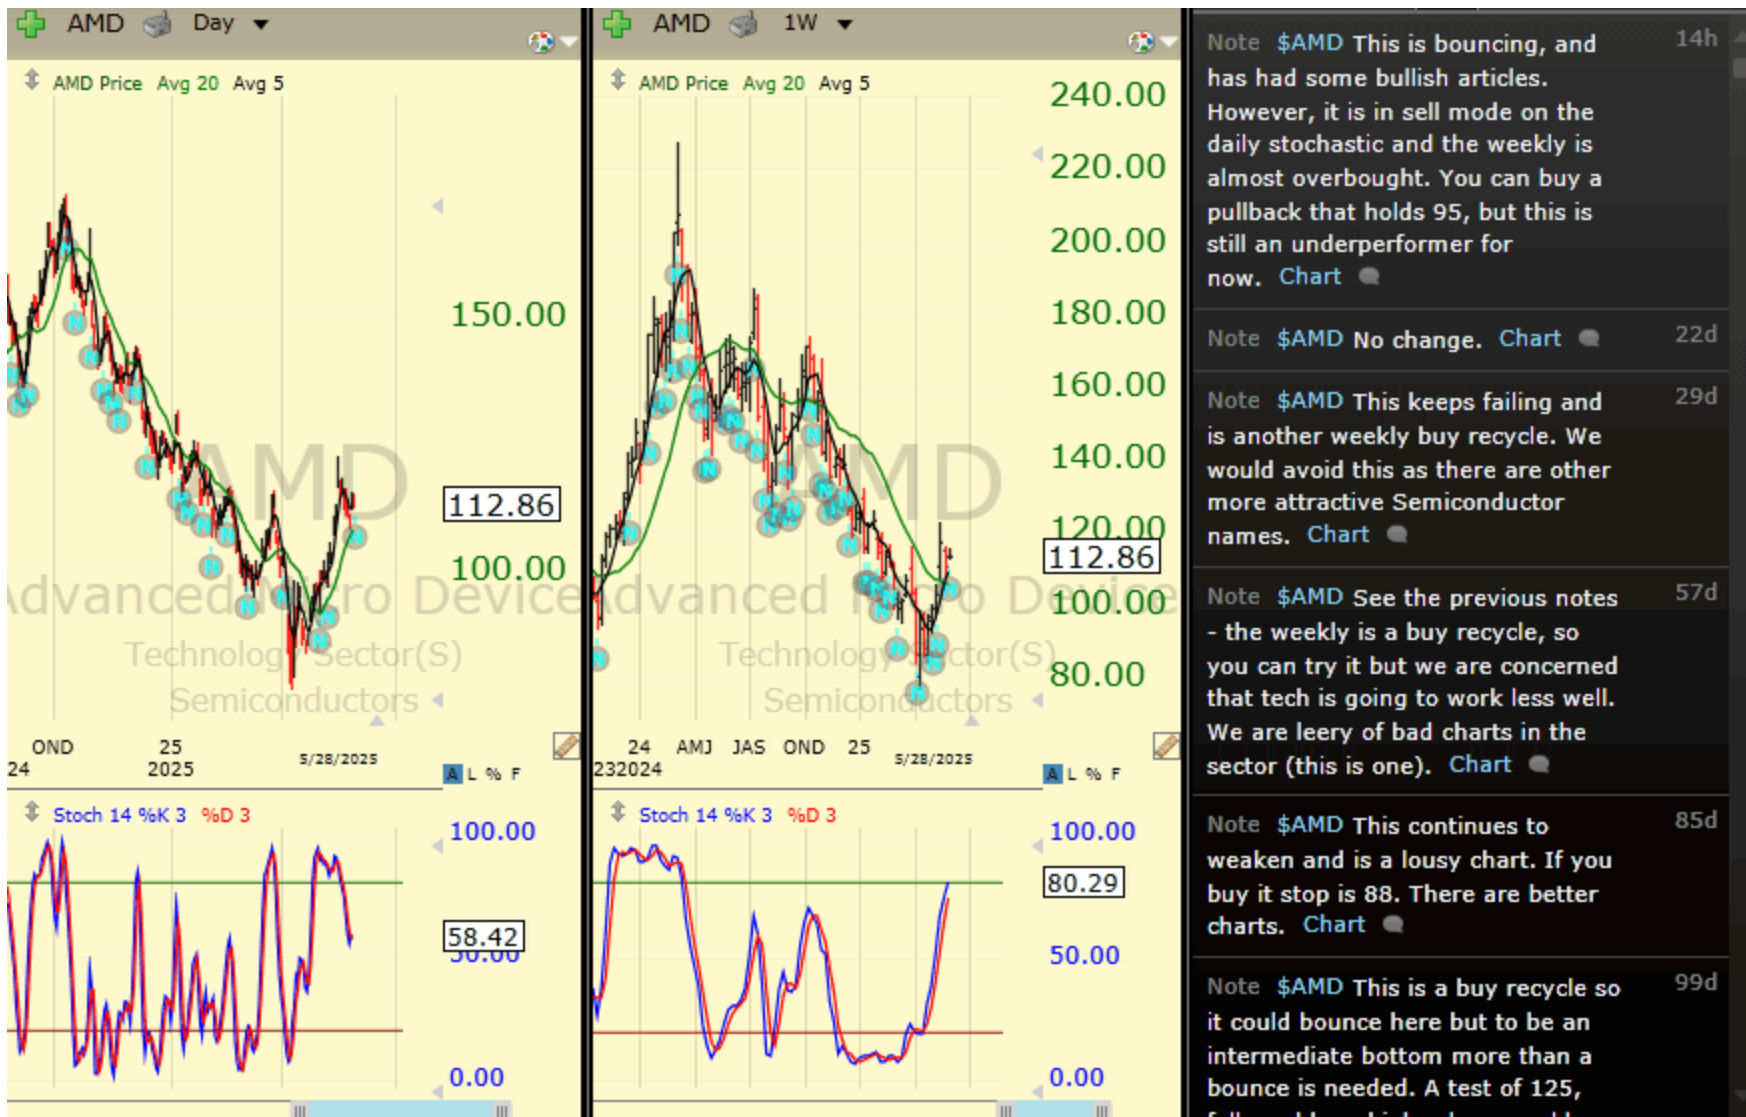

Chartbook: Stocks of Interest

Note \$AMD This is bouncing, and has had some bullish articles. However, it is in sell mode on the daily stochastic and the weekly is almost overbought. You can buy a pullback that holds 95, but this is still an underperformer for now. [Chart](#) 14h

Note \$AMD No change. [Chart](#) 22d

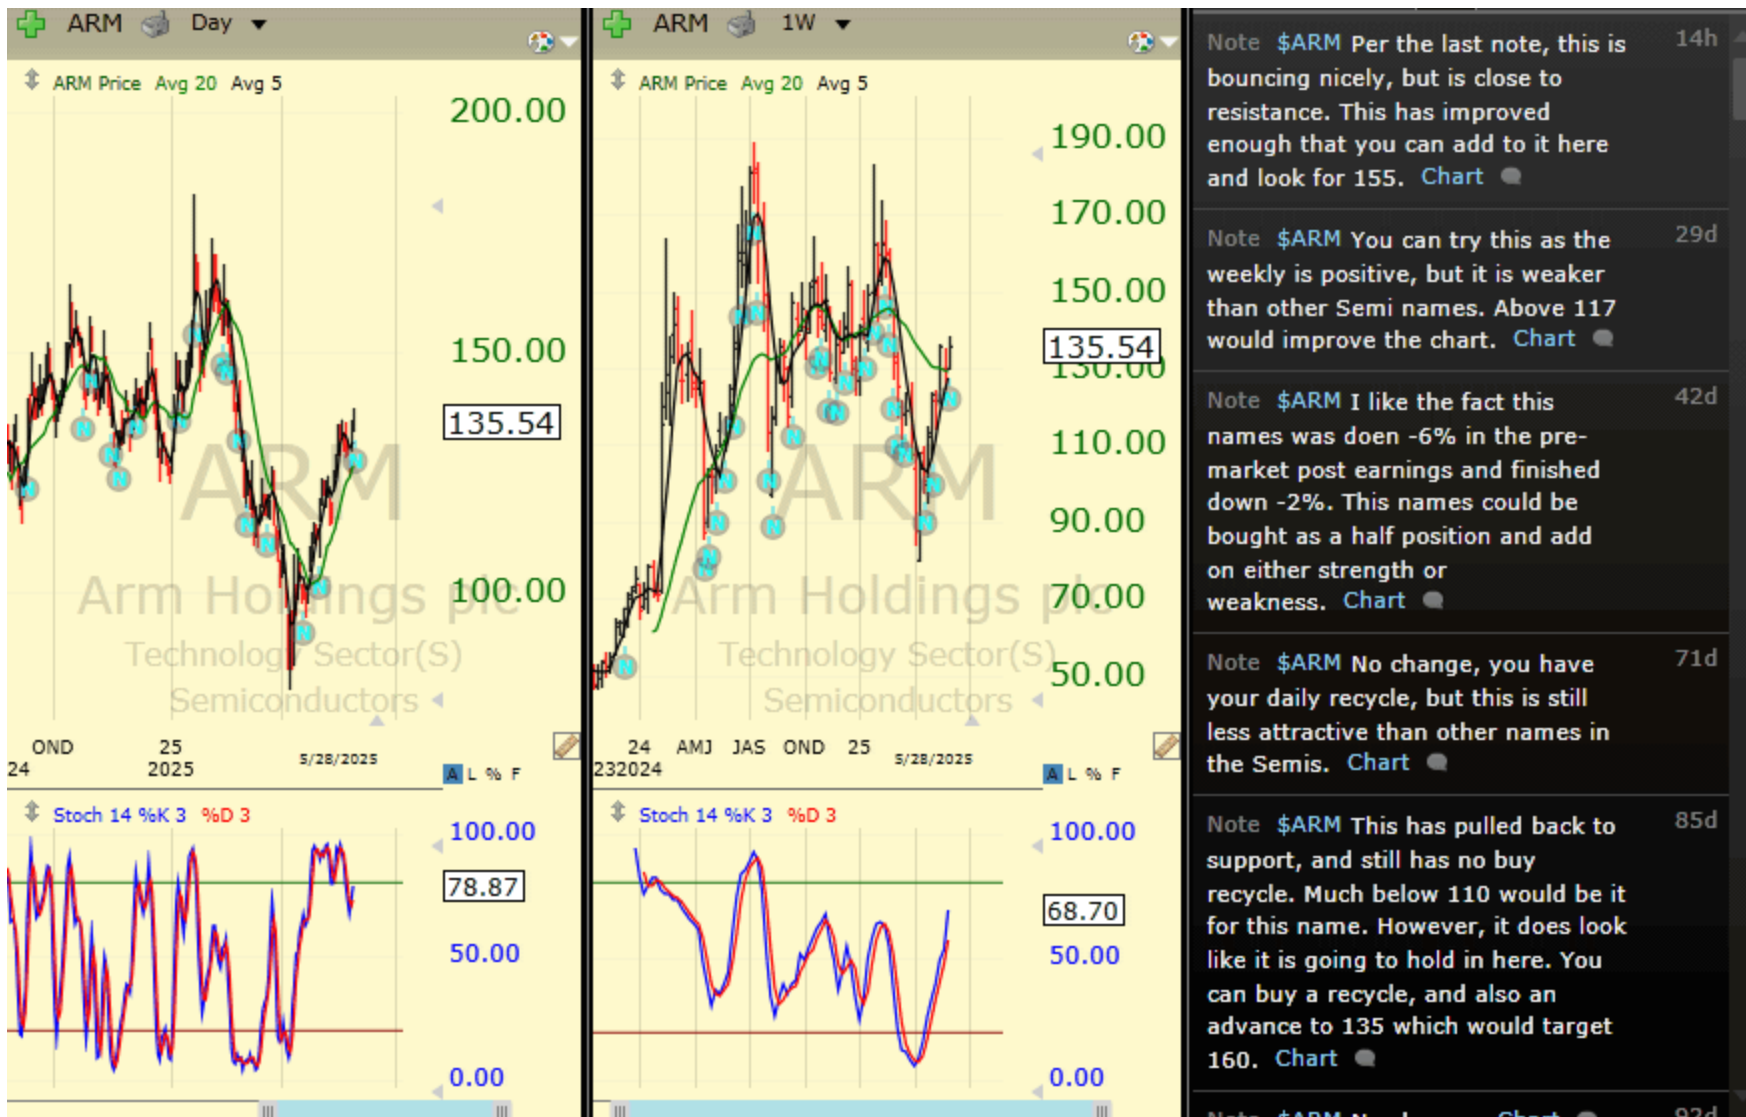

Note \$AMD This keeps failing and is another weekly buy cycle. We would avoid this as there are other more attractive Semiconductor names. [Chart](#) 29d

Note \$AMD See the previous notes - the weekly is a buy cycle, so you can try it but we are concerned that tech is going to work less well. We are leery of bad charts in the sector (this is one). [Chart](#) 57d

Note \$AMD This continues to weaken and is a lousy chart. If you buy it stop is 88. There are better charts. [Chart](#) 85d

Note \$AMD This is a buy cycle so it could bounce here but to be an intermediate bottom more than a bounce is needed. A test of 125, [Chart](#) 99d

Note \$RSPN XLI now looks a bit better, per the last Weekly Review. BUT this is outperforming RSP a little bit, so we like it and it would be a good addition to SPY in portfolios.. [Chart](#)

Note \$RGI This looks a bit better than XLI, the cap weighted sector ETF. Ideally this will move back above 170 on this daily and weekly buy signal. If not, this could be an underperforming sector over the next six months. [Chart](#)

Note \$RGI Can be bought at a lower level. Be patient. [Chart](#)

Note \$RGI This is breaking the 180-area support and unless back above there this week could test the 160 area. We downgraded this sector yearend 2021. [Chart](#)

Note \$RGI This remains a favorite sector. We would buy daily recycles a long as above 175. Long units! [Chart](#)

Note \$RGI Industrials are a favorite sector and this is a strong chart as long as above 114. We would buy daily recycles. [Chart](#)

Technical Indicators

Readers will note that we use the same indicators on all of the charts in this presentation. We append definitions of these indicators and are available via the website: [Education and Training Center](#).

Technicals Defined

Moving Averages:

Moving averages are one of the building blocks of Technical Analysis, and there are almost as many ways to use this indicator as there are technicians.

At the FRED report we teach and use a dual moving average crossover system to determine trend. Our favorites are the 5 period and 20 period moving averages. We consider the trend to be up if the 5 is above the 20, and down if below it.

Stochastics:

The Stochastic Oscillator is one of the commonly used momentum oscillators and is standard on charting programs. There are two lines on the chart below, %K and %D.

%K is the faster of the two lines, and represents a mathematical formula that *measures where the current close is in relation to the trading range of the last "X" periods of time*. We use a 14 period look-back, so in plain English %K says where the current close is in the trading range of the last 14 days, expressed as a %.

At the FRED report we use it somewhat differently than is commonly taught. The standard way to use the indicator is to register a buy signal when it moves below, and then above, 20 (the lowest 20% of closing prices in the last 14 days). A sell signal is when the indicator moves above, and then below 80 (the highest 80% of closes over the last 14 days).

The other line, %D, is a 3 period moving average of %K. We have found that the Stochastic is sensitive, so we advocate taking signals only in the direction of the trend. When looking at the standard FRED report chart, this would mean taking buy signals when the 5 is above the 20, and sell signals when the 5 is below the 20, but using a different technique to exit positions. The reason for this is the Stochastic is quite sensitive, and can give early indications, especially in new trends. It also can get "stuck" in the direction of trends, which connotes strength and not weakness. Another, preferred interpretation, is to use the indicator to measure risk. An example: buy in an uptrend, not when the stochastic is at 90% but rather wait until it falls below 50%, This way, even if a stock, commodity, or ETF does not give one of the "classic" signals, you can still use the indicator to assess risk, and leg into positions.

The FRED Report

Financial Research, Education & Data

The FRED Report (www.theFREDreport.com) was started to provide Financial Advisors and investors access to unbiased market research. The President of The Fred Report, **Fred Meissner, CMT** has been practicing Technical Market Analysis since 1983 and has worked in the research departments of Merrill Lynch and Robinson – Humphrey /Smith Barney. In addition he has served the public as a portfolio manager and financial advisor. We know the problems investors face and have devoted our career to helping find the best possible investments in all environments.
